Factoring numbers with the natural number set is simple. Every number has at least two factors. To find other factors, start dividing the number starting from two and working your way up until you reach that number divided by 2. Any quotient that does not have a remainder means that both the divisor and the quotient are factors of that number.

If a polynomial doesn't factor, it's called prime because its only factors are 1 and itself. When you have tried all the factoring tricks in your bag (GCF, backwards FOIL, difference of squares, and so on), and the quadratic equation will not factor, then you can either complete the square or use the quadratic formula to solve the equation. The choice is yours.

A number's factors are numbers which multiply together to form it as a product. Another way of thinking of this is that every number is the product of multiple factors. Learning how to factor - that is, breaking up a number into its component factors - is an important mathematical skill that is used not only in basic arithmetic but also in algebra, calculus, and beyond.

Factoring Trinomial - Easy Case. The general form of a quadratic trinomial is written as $ax^2 + bx + c$ where a , b , and c are constants. The "easy" case happens when the value of a is equal to $+1$ or -1 , that is $a = 1$ or $a = -1$. You don't need to write the coefficient of 1 before the $\{x^2\}$ term because it is understood..
