Harmonic analysis [Browse] Symmetric spaces [Browse] Summary note. This text explores the geometry and analysis of higher rank analogues of the symmetric spaces introduced in volume one. To illuminate both the parallels and differences of the higher rank theory, the space of positive matrices is treated in a manner mirroring that of the upper-half space in volume one.

The harmonic analysis program has also been carried out in the class of Riemannian symmetric spaces. In this case explicit inversion and Plancherel formulae are known from the work of Harish-Chandra and Helgason. The basic structure of  $G/H$  and the related representations of  $G$  will be developed. Select Lecture 2 - Structure theory

Harmonic performance analysis of natural sampling, modified subharmonic control, symmetric/asymmetric uniform, sinusoidal pulse width modulation, and pulse position modulation strategies have been studied. Results can be used as guidelines for the modulation strategies selection in the PWM inverter design.

In the present paper, we study central limit theorems (CLTs) for non-symmetric random walks on nilpotent covering graphs from a point of view of discrete geometric analysis developed by Kotani and Sunada. We establish a semigroup CLT for a non-symmetric random walk on a nilpotent covering graph.
