Conductors & Overcurrent Protection | Electrical System Design  
Conductor Sizes & Types The area of conductor is expressed in terms of Circular Mils. 1 inch = 1,000 mils to find the area in circular mils, the diameter in mils is just squared.. Area in sq. in. =  $(\pi/4) * (\text{diam. in inches})^2$  Area in mils =  $(\text{diam. in inches} * 1,000)^2$

Needless to say, the NEC covers all aspects of overcurrent protection where electrical safety is an issue (Art. 240, Overcurrent Protection). The topic is straightforward and easy to understand, but it is essential that design and installation work be done correctly if the protection is to be meaningful.

For islanding protection purposes, electrical variable-based passive detection and communication-based active detection are combined. As shown in Figure 5.18, the time of electrical variable detection is limited as required in IEEE std. 929, that is,  $t_1 = 2 \text{ s}$ ,  $t_2 = 0.04 \text{ s}$ , and  $t_3 = 0.1 \text{ s}$ . Communication-based active islanding detection is reliable and easy to achieve, in which the smart ...

With coordinated overcurrent protection, the faulted or overloaded circuit is isolated by the selective operation of only the overcurrent protective device closest to the overcurrent condition. The main goal of selective coordination is to isolate the faulted portion of the electrical circuit quickly while at the same time maintaining power to the remainder of the electrical system.

Overcurrent Protection. A fundamental problem with any kind of solid-state voltage regulator layout, such as that of Figure 5.3(a), is that if the output is short-circuited, the only limit to the current that can flow is the capacity of the input power supply, which could well be high enough to destroy the pass transistor (Q1).
