Surface Modification Of Biomaterials Methods

Plasma modification is one way to alter the surface of biomaterials to enhance their properties. During plasma modification techniques, the surface is subjected to high levels of excited gases that alter the surface of the material. Plasma's are generally generated with a radio frequency (RF) field.

Biomaterial Surface Modifications - Wikipedia

Ion implantation is an effective surface treatment technique that be used to enhance the surface properties of biomaterials. The unique advantage of plasma modification is that the surface properties and biocompatibility can be enhanced selectively while the favorable bulk attributes of the materials such as strength remain unchanged. Overall, it is an effective method to modify medical implants with complex shape.
